

Fitting Instructions For The **CRUSADER** Hitch Lock

These instructions are given to enable you to use our quality product safely and effectively. The correct fitting could be crucial in ensuring the Hitch Lock provides maximum security.

General

The Crusader hitch lock consists of three main elements, the lower plate protects the ball cavity in the hitch and the under side access to the fixing bolts of the hitch to the 'A' frame. The cover protects and fully encloses the handle and upper access to the fixing bolts. The strong lock bolt holds all three parts together.

When used on the tow vehicle or on a security post the lower plate is not used, but the close-fitting cover still protects the fixing bolts and hitch handle.

Fitting Procedure

Lift hitch lever and insert the spigot on the lower plate into the ball cavity. Lower the hitch lever into locked / travelling position.

The plate will be retained in position.

Lower the main cover over the hitch handle to line up the collars on the lower plate with the lock bar bushes in the main cover.

Remove the key from the lock. This will get the lock pin in the correct position for fitting the lock bar.

Insert the lock bar through the main bush and through the two collars on the lower plate.

Push fully home when the lock bar will automatically lock in position

The hitch lock is now correctly fitted.

Removal Procedure

Turn the key anti clockwise to its limit

Withdraw the lock pin completely supporting the weight of the hitch lock with the handle.

Lift the main body of the lock from the hitch.

Using one hand to support the lower plate activate the hitch handle to release the lower plate.

Removal is complete

We recommend that the lock pin is stored in the hitch lock in the locked position.

Remember to store one of your keys in a safe place and make a note of the key number
